## Answer Key

## Determining the Average Reaction Rate

(Honors Chemistry)
At $40{ }^{\circ} \mathrm{C}$, hydrogen chloride gas will form from the reaction of gaseous hydrogen and chlorine, according to the following balanced chemical equation: $\quad \mathrm{H}_{2}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g}) \rightarrow 2 \mathrm{HCl}(\mathrm{g})$

| Time (s) | Molarity of $\mathbf{H}_{\mathbf{2}} \mathbf{( g )}$ | Molarity of $\mathbf{C l}_{\mathbf{2}} \mathbf{( g )}$ | Molarity of $\mathbf{H C l}$ (g) |
| :---: | :---: | :---: | :---: |
| 0 | 1.000 | 1.000 | 0.000 |
| 2.16 | 0.500 | 0.500 | 1.000 |
| 4.32 | 0.250 | 0.250 | 1.500 |
| 6.48 | 0.125 | 0.125 | 1.750 |

Using the data table above, answer questions $1-4$ and show all work. (3 decimal places)

1. Calculate the average reaction rate for the disappearance of hydrogen gas in the first 2.16 s .
( $0.231 \mathrm{~mol} / \mathrm{L} \cdot \mathrm{s}$ )
2. Calculate the average reaction rate for the appearance of hydrogen chloride gas in the first 4.32 s
( $0.347 \mathrm{~mol} / \mathrm{L} \cdot \mathrm{s}$ )
3. Calculate the average reaction rate for the disappearance of chlorine gas between 2.16 s and 4.32 s ( $0.116 \mathrm{~mol} / \mathrm{L} \cdot \mathrm{s}$ )
4. Calculate the average reaction rate for the disappearance of hydrogen gas in the first 4.32 s
( $0.174 \mathrm{~mol} / \mathrm{L} \cdot \mathrm{s}$ )
5. Calculate the average reaction rate for the appearance of hydrogen chloride gas in the first 2.16 s .
( $0 . .463 \mathrm{~mol} / \mathrm{L} \cdot \mathrm{s}$ )
6. Calculate the average reaction rate for the appearance of HCl gas between 4.32 s and 6.48 s
( $0.116 \mathrm{~mol} / \mathrm{L} \cdot \mathrm{s}$ )
7. Using your answers from questions 5 and 6 , explain why the reaction rates during the first 2.16 seconds and the last 2.16 seconds are different?

At standard conditions, Hydrogen peroxide in aqueous solution will decompose to produce oxygen gas and water, according to the following balanced chemical equation: $2 \mathrm{H}_{2} \mathrm{O}_{2}(\mathrm{aq}) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{I})+\mathrm{O}_{2}(\mathrm{~g})$

| Time (s) | Molarity of $\mathrm{H}_{\mathbf{2}} \mathbf{O}_{\mathbf{2}} \mathbf{( a q )}$ | Molarity of $\mathbf{O}_{\mathbf{2}} \mathbf{( g )}$ |
| :---: | :---: | :---: |
| 0 | 0.300 | 0.000 |
| 2 | 0.250 | 0.050 |
| 4 | 0.180 | 0.105 |
| 6 | 0.141 | 0.138 |
| 8 | 0.125 | 0.141 |
| 10 | 0.118 | 0.150 |

Using the data table above, answer questions 8 - 14 and show all work. (3 decimal places)
8. Calculate the average reaction rate for the disappearance of $\mathrm{H}_{2} \mathrm{O}_{2}$ in the first 4 s .
(0.030 mol/L.s)
9. Calculate the average reaction rate for the appearance of oxygen gas in the first 4 s

$$
\text { ( } 0.026 \mathrm{~mol} / \mathrm{L} \cdot \mathrm{~s} \text { ) }
$$

10. Calculate the average reaction rate for the disappearance of $\mathrm{H}_{2} \mathrm{O}_{2}$ between 2 s and 6 s .
(0.027 mol/L•s)
11. Calculate the average reaction rate for the appearance of oxygen gas between 2 s and 6 s .
(0.022 mol/L•s)
12. Calculate the average reaction rate for the disappearance of $\mathrm{H}_{2} \mathrm{O}_{2}$ between 6 s and 10 s .

$$
\text { ( } 0.006 \mathrm{~mol} / \mathrm{L} \cdot \mathrm{~s} \text { ) }
$$

13. Calculate the average reaction rate for the appearance of oxygen gas between 6 s and 10 s . ( $0.003 \mathrm{~mol} / \mathrm{L} \cdot \mathrm{s}$ )
14. Calculate the average reaction rate for the disappearance of $\mathrm{H}_{2} \mathrm{O}_{2}$ during the entire 10 s reaction.

$$
\text { ( } 0.018 \mathrm{~mol} / \mathrm{L} \cdot \mathrm{~s} \text { ) }
$$

15. Calculate the average reaction rate for the appearance of oxygen gas during the entire 10 s reaction.
(0.015 mol/L•s)
16. For both $\mathrm{H}_{2} \mathrm{O}_{2}$ and $\mathrm{O}_{2}$, compare the average reaction rates during the first 4 seconds of the reaction and the last 4 seconds of the reaction. Explain the data.
